

Evolution vs Creationism:

By Paul Herring

M.Sc (Physics), Dip. Tchg, M.A.C.S.(PCP)

Presented 2005

Why look at this issue at all? How important is it?

Clearly our salvation is not dependent on it but our success in preaching the Gospel to today's world may be.

- Do not be mistaken – Evolution is a religion and is Anti-God
- It is a significant issue, which the devil and our own sinful nature/rationalisation use to keep us from following God and fully embracing his plan and purpose.
- It is an especially significant issue with the youth of today (15-21 year olds) in our schools and Universities.
- Some of the ways we respond to this issue, including the lack of importance we generally attach to it, are counter-productive and can even be an impediment to the Gospel. I.e.
 - Theistic evolution is a contradiction in terms; at least in the way evolutionists define it.
 - I will also try to show how recent creationism is a position with limited scientific credibility, as well as being questionable theologically, and I will argue unnecessary.

Creationism, if properly promoted by the church should help society to stop seeing the Christian faith as irrational religious ideology and show that the scientific evidence does actually harmonize with the biblical view of creation.

Within the basic questions of origin that the creation/evolution debate address lies the foundations on which the modern mind defines reality.

We need to reassert the reality of a Creator and then help people understand that the Bible is the main source that reveals God's plan and purpose for this Universe and mankind.

The widespread belief in evolutionary theories of origin may have done more to undermine moral restraint in our society than any other belief or ideology.

No other popular philosophy has lead to Christianity's appearance of irrelevance more than this.

This series is divided into three sections or sessions:

- 1. An outline of why and how Evolutionists or Darwinists are in an unbeatable position in their ‘science’ because of how they define the terms and frames of reference. This section should also help you understand why they can’t see the evidence against them.**
- 2. The second section will look at the scientific evidence as it relates to creation, succession, and evolution. This section will also look at the scientific support for ancient creationism.**
- 3. The third section will be a look at what the Bible does and doesn’t tell us about Creation and how we might understand it and some of the apparent contradictions in Genesis.**

Session 1:

What is Darwinism

– (mostly verbatim from an article by Prof. Phillip Johnson)

Let us first explain the all-important Evolutionist or Darwinian vocabulary. As long as Darwinists control the definitions of the key terms, their system is unbeatable regardless of the evidence.

There is a popular television game show called *Jeopardy!* in which the usual order of things is reversed. Instead of being asked a question to which they must supply the answer, contestants are given the answer and asked to provide the appropriate question. This format suggests an insight that is applicable to law, to science and indeed to just about everything. The important thing is not necessarily to know all the answers but rather to know what question is being asked.

That insight is the starting point for our look at Darwinian evolution and its relationship to creation, because Darwinism is the answer to two very different kinds of questions. First, Darwinian theory tells us how a certain amount of diversity in life forms can develop once we have various types of complex living organisms already in existence. If a small population of birds happens to migrate to an isolated island, for example, a combination of inbreeding, mutation and natural selection may cause this isolated population to develop different characteristics from those possessed by the ancestral population on the mainland. When the theory is understood in this limited sense, Darwinian evolution is uncontroversial and has no important philosophical or theological implications.

But evolutionary biologists are not content merely to explain how variation occurs within limits. They aspire to answer a much broader question: how complex organisms like birds and flowers and human beings came into

existence in the first place. The Darwinian answer to this second question is that the creative force that produced complex plants and animals from single-celled predecessors over long stretches of geological time is essentially the same as the mechanism that produces variations in flowers, insects and domestic animals before our very eyes. In the words of Ernst Mayr, the dean of living Darwinists, "trans-specific evolution [i.e., macroevolution] is nothing but an extrapolation and magnification of the events that take place within populations and species."

Neo-Darwinian evolution in this broad sense is a philosophical doctrine so lacking in empirical support that Mayr's successor at Harvard, Stephen Jay Gould, once pronounced it in a reckless moment to be "effectively dead." Yet neo-Darwinism is far from dead; on the contrary, it is continually proclaimed in the textbooks and the media as unchallengeable fact. How does it happen that so many scientists and intellectuals, who pride themselves on their empiricism (meaning: based on experience or observed facts) and open-mindedness, continue to accept an unempirical theory as scientific fact?

The answer to that question lies in the definition of five key terms. The terms are **creationism, evolution, science, religion and truth**. Once we understand how these words are used in evolutionary discourse, the continued ascendancy of neo-Darwinism will be no mystery and we need no longer be deceived by claims that the theory is supported by "overwhelming evidence."

I should warn at the outset, however, that using words clearly is not the innocent and peaceful activity most of us may have thought it to be. There are powerful vested interests in this area which can thrive only in the midst of ambiguity and confusion. Those who insist on defining terms precisely and using them consistently may find themselves regarded with suspicion and hostility and even accused of being enemies of science. But let us accept that risk and proceed to the definitions.

The correct use of words or 'correct words' used – sometimes called semantics is very powerful. It is perhaps no more obvious than in the Pro-life debate where terms like 'termination of pregnancy' and 'euthanasia' (meaning a painless or good death) are used for the killing of human beings.

[*Tape recording played here:* Let us listen to Bernard Nathanson on this issue – this portion of an interview with Bernard Nathanson on a Christian radio station may shock some of you but it helps emphasize the seriousness of the issue.]

Creation and Creationism

The first word is *creationism*, which literally means no more than the belief that there is a Creator. In Darwinist usage, which dominates not only the popular and professional scientific literature but also the media, a creationist is a person who takes the creation account in the book of Genesis to be true

in a very literal sense. The earth was created in a single week of six twenty-four-hour days *no more than ten thousand years ago* (even though the Bible does not state this); the major features of the earth's geology were produced by Noah's flood; and there have been no major innovations in the forms of life since the beginning. It is a major theme of Darwinist propaganda that the only persons who have any doubts about Darwinism are **young-earth creationists** of this sort, who are always portrayed as rejecting the clear and convincing evidence of science to preserve a religious prejudice. The implication is that citizens of modern society are faced with a choice that is really no choice at all. Either they reject science altogether and retreat to a premodern (or unscientific and 'uninformed') worldview, or they believe everything the Darwinists tell them.

In a broader sense, however, a creationist is simply a person who believes in the existence of a Creator who brought about the existence of the world and its living inhabitants in furtherance of a purpose. Whether the process of creation took a single week or billions of years is relatively unimportant from a philosophical or theological standpoint. Creation by gradual processes over geological ages may create problems for biblical interpretation, but it creates none for the basic principle of theistic religion. And creation in this broad sense, according to a 1991 Gallop poll, is the creed of 87 percent of Americans. If God brought about our existence for a purpose, then the most important kind of knowledge to have is knowledge of God and of what he intends for us. Is creation in that broad sense consistent with evolution?

Evolution and Naturalism

The answer is absolutely not, when evolution is understood in the Darwinian sense. To Darwinists evolution means *naturalistic* evolution, because they insist that science must assume that the cosmos is a closed system of material causes and effects which can never be influenced by anything outside of material nature -by God, for example.

In the beginning, an explosion of matter created the cosmos, and undirected, naturalistic evolution produced everything that followed. From this philosophical standpoint it follows deductively that from the beginning no intelligent purpose guided evolution. If intelligence exists today, then is only because it has itself evolved through purposeless material processes. A materialistic theory of evolution must inherently invoke two kinds of processes. At bottom the theory must be based on chance, because that is what is left when we have ruled out everything involving intelligence or purpose. Theories that invoke *only* chance, though, are unbelievable. One thing everyone acknowledges is that living organisms are enormously complex -far more so than, say, a computer or an airplane. That such complex entities came into existence simply by chance is clearly less credible than that they were designed and constructed by a Creator.

To back up their claim that this appearance of intelligent design is an illusion, Darwinists need to provide some complexity-building force that is mindless and purposeless. Natural selection is by far the most plausible candidate.

If we assume that random genetic mutations provided the new genetic information needed, say, to give a small mammal a start toward wings, and if we assume that each tiny step in the process of wing building gave the animal an increased chance of survival, then natural selection ensured that the favored creatures would thrive and reproduce. It follows as a matter of logic that wings can and will appear as if by the plan of a designer. Of course if wings or other improvements do *not* appear, the theory explains their absence just as well. The needed mutations didn't arrive, or "developmental constraints" closed off certain possibilities, or natural selection favored something else. There is no requirement that any of this speculation be confirmed by either experimental or fossil evidence. For Darwinists, just being able to imagine the process is sufficient to confirm that something like that must have happened.

Richard Dawkins calls the process of creation by mutation and selection "the blind watchmaker," by which label he means that a purposeless, materialistic designing force substitutes for the "watchmaker" deity of natural theology. The creative power of the blind watchmaker is supported by only very slight evidence, such as the famous example of a moth population in which the percentage of dark moths increased during a period when birds were better able to see light moths against smoke-darkened background trees. This may be taken to show that natural selection can do *something*, but not that it can create anything that was not already in existence. Even such slight evidence is more than sufficient, however, because evidence is not really necessary to prove something that is practically self-evident. The existence of a potent blind watchmaker follows deductively from the philosophical premise that nature had to do its own creating. There can be argument about the details, but if God was not in the picture something very much like Darwinism simply has to be true, regardless of the evidence.

[Philosophical argument for design: rocks forming 'Marlborough' outlined here]

Science and Its Paradigms

That brings us to the third term, **science**. We have already seen that Darwinists assume as a matter of first principle that the history of the cosmos and its life forms is fully explainable on naturalistic principles. This reflects a philosophical doctrine called **scientific naturalism**, which is said to be a necessary consequence of the inherent limitations of science. What scientific naturalism does, however, is to transform the limitations of science into limitations on reality, in the interest of maximizing the explanatory power of science and its practitioners. It is, of course, entirely possible to study organisms scientifically on the premise that they were all created by God, just as scientists study airplanes and even works of art without denying that these objects are intelligently designed. The problem with allowing God a role in the history of life is not that science would cease but rather that scientists would have to acknowledge the existence of something important that is outside the boundaries of natural science. For scientists who want to

be able to explain everything -and "theories of everything" are now openly anticipated in the scientific literature-this is an intolerable possibility.

The second feature of scientific naturalism that is important for our purpose is its set of rules governing the criticism and replacement of a paradigm. A paradigm is a general theory, like the Darwinian theory of evolution, that has achieved general acceptance in the scientific community. The paradigm unifies the various specialties that make up the research community and guides research in all of them. Thus zoologists, botanists, geneticists, molecular biologists and paleontologists all see their research as aiming to fill out the details of the Darwinian paradigm. If molecular biologists see a pattern of apparently neutral mutations that have no apparent effect on an organism's fitness, they must find a way to reconcile their findings with the paradigm's requirement that natural selection guides evolution.

This they can do by postulating a sufficient number of invisible adaptive mutations, which are deemed to be accumulated by natural selection. Similarly, if paleontologists see new fossil species appearing suddenly in the fossil record and remaining basically unchanged thereafter, they must perform whatever contortions are necessary to force this recalcitrant evidence into a model of incremental change through the accumulation of micromutations.

Supporting the paradigm may even require what in other contexts would be called deception. As Niles Eldredge has candidly admitted, "We paleontologists have said that the history of life supports [the story of gradual adaptive change], all the while knowing it does not." Eldredge explained that this pattern of misrepresentation occurred because of "the certainty so characteristic of evolutionary ranks since the late 1940s, the utter assurance not only that natural selection operates in nature, but that we know precisely how it works." This certainty produced a degree of dogmatism that Eldredge says resulted in the relegation of the "lunatic fringe" of paleontologists who reported that "they saw something out of kilter between contemporary evolutionary theory, on the one hand, and patterns of change in the fossil record on the other." Under the circumstances, prudent paleontologists understandably swallowed their doubts and supported the ruling ideology. To abandon the paradigm would be to abandon the scientific community; to ignore the paradigm and just gather the facts would be to earn the demeaning label "stamp collector."

As many philosophers and scientists have observed, the research community does not abandon a paradigm in the absence of a suitable replacement. This means that negative criticism of Darwinism, however devastating it may appear to be, is essentially irrelevant to the professional researchers. The critic may point out, for example, that the evidence that natural selection has any creative power is somewhere between weak and nonexistent. That is perfectly true, but to Darwinists the more important question is this: If natural selection did not do the creating, what did? "God" is obviously unacceptable, because such a being is unknown to science. "We don't know" is equally unacceptable, because to admit ignorance would be to leave science adrift

without a guiding principle. To put the problem in the most practical terms: it is impossible to write or evaluate a grant proposal without a generally accepted theoretical framework.

The paradigm rule explains why Gould's acknowledgment that neo-Darwinism is "effectively dead" had no significant effect on the Darwinist faithful, or even on Gould himself. Gould made that statement in a paper predicting the emergence of a new general theory of evolution, one based on the macromutational speculations of the Berkeley geneticist Richard Goldschmidt. When the new theory did not arrive as anticipated, the alternatives were either to stick with Ernst Mayr's version of neo-Darwinism or to concede that biologists do not after all know of a naturalistic mechanism that can produce biological complexity.

That was no choice at all. Gould had to beat a hasty retreat back to classical Darwinism to avoid giving aid and comfort to the enemies of scientific naturalism, including those disgusting creationists.

Having to defend a dead theory tooth and nail can hardly be a satisfying activity, and it is no wonder that Gould lashes out with fury at writers such as Phillip Johnson who calls attention to his predicament. Johnson does however have a genuinely high regard for Gould as one of the few Darwinists who have recognized the major problems with the theory and reported them honestly. His tragedy is that he cannot admit the clear implications of his own thought without effectively resigning from science.

The continuing survival of Darwinist orthodoxy illustrates Thomas Kuhn's remark that the accumulation of anomalies never in itself falsifies a paradigm, because "to reject one paradigm without substituting another is to reject science itself." This practice may be appropriate as a way of carrying on the professional enterprise called science, but it can be grossly misleading when it is imposed on persons who are asking questions other than the ones scientific naturalists want to ask. Suppose, for example, that I want to know whether God really had something to do with creating living organisms. A typical Darwinian response is that there is no reason to invoke supernatural action, because Darwinian selection was capable of performing the job. To evaluate that response, I need to know whether natural selection really has the fantastic creative power attributed to it. It is not a sufficient answer to say that scientists have nothing better to offer. The fact that scientists don't like to say "We don't know" tells me nothing about what they really *do* know.

This is not to suggest that scientists have to change their rules about retaining and discarding paradigms. All we want them to do is to be candid about the disconfirming evidence and admit, if it is the case, that they are hanging on to Darwinism only because they prefer a shaky theory to no theory at all. What they insist on doing, however, is to present Darwinian evolution to the public as a fact that every rational person is expected to accept. If there are reasonable grounds to doubt the theory, such dogmatism is ridiculous, whether or not the doubters have a better theory to propose.

Religion and Reason

To believers in creation, the Darwinists seem thoroughly intolerant and dogmatic when they insist that their own philosophy must have a monopoly in the schools and the media. The Darwinists do not see themselves that way, of course. On the contrary, they often feel aggrieved when creationists (in either the broad or the narrow sense) ask to have their own arguments heard in public and fairly considered.

To insist that schoolchildren be taught that Darwinian evolution is a fact is in their minds merely to protect the integrity of science education; to present the other side of the case would be to allow fanatics to force their opinions on others. Even college professors have been forbidden to express their doubts about Darwinian evolution in the classroom, and it seems to be widely believed that the American Constitution not only permits but actually requires such restrictions on academic freedom. To explain this bizarre situation, we must define our fourth term.

Religion

Suppose a skeptic argues that evidence for biological creation by natural selection is obviously lacking and that in the circumstances we ought to give serious consideration to the possibility that the development of life required some input from a preexisting, purposeful Creator. To scientific naturalists this suggestion is "creationist" and therefore unacceptable in principle, because it invokes an entity unknown to science. What is worse, it suggests the possibility that this Creator may have communicated in some way with humans. In that case there could be real prophets i.e. - persons with a genuine knowledge of God who are neither frauds nor dreamers. Such persons could conceivably be dangerous rivals to the scientists as cultural authorities. The strategy that naturalistic philosophy has worked out to prevent this problem from arising is to label naturalism as science and theism as religion. The former is then classified as **knowledge** and the latter as mere **belief**.

The distinction is of critical importance, because only knowledge can be objectively valid for everyone; belief is valid only for the believer and should never be passed off as knowledge. The student who thinks that 2 and 2 make 5, or that water is not made up of hydrogen and oxygen, or that the theory of evolution is not true, is not expressing a minority viewpoint. He or she is ignorant, and the job of education is to cure that ignorance and replace it with knowledge. Students in the public schools are thus to be taught at an early age that "evolution is a fact:" and as time goes by they will gradually learn that evolution means naturalism.

In short, the proposition that God was in any way involved in our creation is effectively outlawed and implicitly negated. This is because naturalistic evolution is by definition in the category of scientific knowledge. What contradicts knowledge is implicitly false or imaginary. That is why it is possible for scientific naturalists in good faith to claim on the one hand that

their science says nothing about God and to claim on the other hand that they have said everything that can be said about God! In naturalistic philosophy both propositions are at bottom the same. All that needs to be said about God is that there is nothing to be said of God, because on that subject we can have no knowledge.

Truth

Our fifth and final term is *truth*. Truth as such is not a particularly important concept in naturalistic philosophy. The reason for this is that "truth" suggests an unchanging absolute, whereas scientific knowledge is a dynamic concept.

What was knowledge in the past is not knowledge today, and the knowledge of the future will surely be far superior to what we have now. Only naturalism itself and the unique validity of science as the path to knowledge are absolutes. There can be no criterion for truth outside of scientific knowledge, no mind of God to which we have access.

This way of understanding things persists even when scientific naturalists employ religious-sounding language. For example, the physicist Stephen Hawking ended his famous book *A Brief History of Time* with the prediction that human beings might one day "know the mind of God." This phrasing caused some to form the mistaken impression that he had some attraction to theistic religion. In context Hawking was not referring to a supernatural eternal being, however, but to the possibility that scientific knowledge will eventually become complete and all-encompassing because it will have explained the movements of material particles in all circumstances.

[aside about Stephen Hawking's, the great Atheist physicist, and his Christian wife's beliefs told here]

The monopoly of science in the realm of knowledge explains why evolutionary biologists do not find it meaningful to address the question whether the Darwinian theory is true. They will gladly concede that the theory is incomplete and that further research into the mechanisms of evolution is needed. At any given point, though, the reigning theory of naturalistic evolution represents the state of scientific knowledge about how we came into existence. Scientific knowledge is by definition the closest approximation to absolute truth available to us. To ask whether this knowledge is true is therefore to miss the point and to betray a misunderstanding of "how science works."

So far we have looked at the metaphysical categories (or techniques) by which scientific naturalists have excluded the topic of God from rational discussion and thus ensured that Darwinism's fully naturalistic creation story is effectively true by definition. There is no need to explain why atheists find this system of thought-control congenial. What is a little more difficult to understand, at least at first, is the strong support Darwinism continues to receive in the Christian academic world. Attempts to investigate the credibility of the Darwinist evolution story are regarded with little enthusiasm

by many leading Christian professors of science and philosophy, even at institutions that are generally regarded as conservative in theology.

Given that Darwinism is inherently naturalistic and therefore antagonistic to the idea that God had anything to do with the history of life, and that it plays the central role in ensuring agnostic domination of the intellectual culture, one might have supposed that Christian intellectuals (along with religious Jews) would be eager to find its weak spots. Instead the prevailing view among Christian professors has been that Darwinistic "evolution," as they tend to call it - is unbeatable and that it can be interpreted to be consistent with Christian belief.

Theistic Evolution

In fact Darwinism *is* unbeatable as long as one accepts the thought categories of scientific naturalism that I have been describing. The problem is that those same thought categories relegate Christian theism, or any other theism, to the never-never land of subjective belief. If science has exclusive authority to tell us how life was created, and if science is committed to naturalism, and if science never discards its paradigm until it is presented with an acceptable naturalistic alternative, then Darwinism's position is impregnable within science. The same reasoning that makes Darwinism inevitable, however, also bans God from taking any action within the history of the cosmos, which means that it makes theism illusory. Theistic naturalism is self -contradictory.

Some hope to avoid the contradiction by asserting that naturalism rules only within the realm of science and that there is a separate realm called "religion" in which theism can flourish. The problem with this arrangement, as we have already seen, is that in a naturalistic culture scientific conclusions are considered to be knowledge, or even fact. What is outside of fact is fantasy, or at best subjective belief. Theists who accommodate scientific naturalism therefore may never affirm that their God is *real* in the same sense that evolution is real.

Under naturalistic rules, evolution is confirmed by scientific evidence and hence is real for all reasonable purposes; whatever role God may have taken in the process is inherently superfluous and invisible, - except to believers.

This distinction is essential to the entire mindset that produced Darwinism in the first place. If God exists, he could certainly work through mutation and selection if that is what he wants to do, but he could also create by some means totally outside the realm of our science.

Once we put God into the picture, there is no good reason to attribute the creation of biological complexity to random mutation and natural selection. Direct evidence that these mechanisms have substantial creative power is not to be found in nature, the laboratory or the fossil record. An essential step in the reasoning that establishes that Darwinian selection created the

wonders of biology, therefore, is that nothing else was available. Theism is by definition the doctrine that something else was available. Allow a preexisting supernatural intelligence to guide evolution, and this omnipotent being can do a whole lot more than that.

Of course theists, or Christians can think of evolution as God-guided whether naturalistic Darwinists like it or not. The trouble with having a private definition for theists, however, is that the scientific naturalists have the power to decide what *evolution* means in public discourse, including science classes in the public schools. If theistic evolutionists broadcast the message that evolution as *they* understand it is harmless to theistic religion, they are misleading their constituents - unless they add a clear warning that the version of evolution advocated by the entire body of mainstream science is something else altogether. That warning is never clearly delivered, because the main point of theistic evolution is to preserve peace with the mainstream scientific community. Theistic evolutionists therefore unwittingly serve the purposes of scientific naturalists, by helping persuade the religious community to lower its guard against the incursion of naturalism.

We are now in a position to answer the question with which I began: What is Darwinism?

Darwinism is a theory of empirical science only at the level of microevolution, where it provides a framework for explaining such things as the diversity that arises when small populations become reproductively isolated from the main body of their species. As a general theory of biological creation, Darwinism is not empirical at all. Rather, it is a necessary implication of a philosophical doctrine called scientific naturalism, which is based on the a priori assumption that God was always absent from the realm of nature. As such, evolution in the Darwinian sense is inherently antithetical (i.e anti-God) to theism, although evolution in some entirely different and non-naturalistic sense could conceivably have been God's chosen method of creation.

What Is Darwinism?

In 1874 the great Presbyterian theologian Charles Hodge asked the question "What is Darwinism?" After a careful and thoroughly fair-minded evaluation of the doctrine, his answer was unequivocal: "It is Atheism."

Another way to state the proposition is to say that Darwinism is the answer to a specific question that grows out of philosophical naturalism. To return to the game of Jeopardy with which we started, let us say that Darwinism is the answer. What, then, is the question? The question is: How must creation have occurred if we assume that God had nothing to do with it?

Theistic evolutionists accomplish very little by trying to Christianize the answer to a question that comes straight out of the agenda of scientific naturalism. Instead we need to challenge the assumption that the only questions worth asking are the ones that assume that naturalism is true.
